

1. SOCIAL WELFARE DEPARTMENT

SW-01 — AI-Based Welfare Scheme Eligibility & Assistance Navigator

Citizen-side problem: Citizens may not know which government welfare schemes they are eligible for, what documents are required, or how to apply.

Problem Statement: Develop an AI-based system that understands a citizen's basic circumstances and identifies potentially relevant welfare schemes, eligibility requirements, required documents and application procedures. The system should provide simple, accessible guidance while clearly indicating that final eligibility is determined by the department.

SW-02 — AI-Based Welfare Grievance & Service Assistant

Citizen-side problem: Citizens may struggle to understand where to raise complaints or obtain information regarding pensions, assistance, disability services and other welfare programmes.

Problem Statement: Develop an AI-powered multilingual assistant that understands citizen queries and grievances, identifies the relevant welfare service, provides information from an approved knowledge base and guides the citizen to the appropriate service or grievance channel.

SW-03 — AI-Based Welfare Application Screening & Case Prioritisation

Government-side problem: Officials may have to manually examine large numbers of applications, documents and case records, making it difficult to quickly identify incomplete or inconsistent applications.

Problem Statement: Develop an AI-based decision-support system that extracts information from applications and documents, identifies missing or inconsistent information, groups cases by status and highlights cases requiring official attention.

SW-04 — AI-Based Welfare Service Gap & Coverage Analysis

Government-side problem: Officials may find it difficult to identify areas where eligible beneficiaries are not being adequately reached or where applications and services are accumulating.

Problem Statement: Develop an AI analytics system that analyses beneficiary and service-delivery data to identify coverage gaps, unusual patterns, pending cases and geographical areas requiring greater administrative attention.

2. AGRICULTURE DEPARTMENT

AG-01 — AI-Based Crop Disease Detection & Advisory

Citizen/Farmer-side problem: Farmers may have difficulty identifying crop diseases at an early stage and deciding what action to take.

Problem Statement: Develop an AI system that analyses crop/leaf images and relevant information to identify possible diseases or abnormalities and provide basic preventive and management guidance, with referral to agricultural experts when necessary.

AG-02 — AI-Based Agricultural Advisory Assistant

Citizen/Farmer-side problem: Farmers may need timely advice on crops, cultivation practices, irrigation, pests and weather-related risks but may not have easy access to agricultural experts.

Problem Statement: Develop an AI-powered farmer assistant that understands farmer queries and provides reliable, easy-to-understand advice using an approved agricultural knowledge base and available contextual information.

AG-03 — AI-Based Farmer Query & Field-Visit Prioritisation System

Government-side problem: Agricultural officers and extension workers may receive numerous farmer queries and requests for field assistance, making it difficult to prioritise cases and respond quickly.

Problem Statement: Develop an AI system that categorises farmer queries, identifies urgency and location, detects recurring issues and helps officials prioritise field visits and expert intervention.

AG-04 — AI-Based Crop & Pest Risk Monitoring System

Government-side problem: Agricultural officials need to monitor crop conditions and potential pest or disease outbreaks across large geographical areas, but field-based monitoring can be resource-intensive.

Problem Statement: Develop an AI-based monitoring system that combines sample crop, weather, pest and geographical data to identify areas showing increased risk and provide an early-warning dashboard for agricultural officials.

3. PUBLIC WORKS DEPARTMENT

PWD-01 — AI-Based Road Damage Reporting & Detection

Citizen-side problem: Citizens encounter potholes, cracks and damaged roads but reporting these issues and providing accurate location information may not always be easy.

Problem Statement: Develop an AI-enabled mobile/web system through which citizens can submit road photographs or videos, automatically identify visible road defects and capture their location for reporting to the concerned authority.

PWD-02 — AI-Based Citizen Road Complaint Assistant

Citizen-side problem: Citizens may not know which authority or service channel should handle different road-related complaints.

Problem Statement: Develop an AI assistant that understands citizen complaints, identifies the nature and location of the issue and guides the citizen towards the appropriate reporting or grievance channel.

PWD-03 — AI-Based Road Inspection & Maintenance Prioritisation

Government-side problem: PWD officials cannot physically inspect every road section frequently and must decide where limited maintenance resources should be deployed.

Problem Statement: Develop an AI-based system that analyses road images, road condition, traffic, connectivity, previous maintenance and other relevant data to identify defects and support maintenance prioritisation.

PWD-04 — AI-Based Construction Progress Monitoring

Government-side problem: Monitoring multiple infrastructure projects requires regular field inspections and comparison of actual progress with planned milestones.

Problem Statement: Develop an AI system that analyses periodic site photographs/videos and project information to identify visible progress, potential delays and areas requiring further inspection or intervention.

4. TRANSPORT DEPARTMENT

TR-01 — AI-Based Citizen Transport Service Assistant

Citizen-side problem: Citizens may find it difficult to understand transport-related procedures, required documents, fees, services and application processes.

Problem Statement: Develop a conversational AI assistant that provides verified information from an approved government knowledge base and guides citizens through relevant transport services and procedures.

TR-02 — AI-Based Road Safety Reporting & Risk Awareness System

Citizen-side problem: Citizens may encounter dangerous road locations or recurring traffic-safety issues but may not have an effective way to report and understand such risks.

Problem Statement: Develop an AI-enabled platform that allows citizens to report road-safety issues and uses location and incident information to identify recurring safety concerns.

TR-03 — AI-Based Transport Document Verification Assistant

Government-side problem: Transport officials may need to manually examine large volumes of vehicle and permit-related documents, making verification time-consuming.

Problem Statement: Develop an AI-based OCR and document-analysis system that extracts information, checks completeness and identifies inconsistencies or suspicious patterns for manual verification by officials.

TR-04 — AI-Based Road Accident & Traffic Risk Analysis

Government-side problem: Transport authorities need to identify locations and conditions associated with higher accident or traffic risk to support targeted interventions.

Problem Statement: Develop an AI-based system that analyses accident history, traffic volume, road characteristics, time, weather and location data to identify recurring risk patterns and generate a risk map.

5. EDUCATION (S) DEPARTMENT

ED-01 — AI-Based Personalised Learning Assistant

Citizen/Student-side problem: Students may struggle with particular subjects or concepts but may not receive learning support suited to their individual needs.

Problem Statement: Develop an AI learning assistant that identifies a student's learning gaps and provides personalised explanations, practice questions and learning activities appropriate to their level.

ED-02 — AI-Based Parent/Student School Information Assistant

Citizen-side problem: Parents and students may need information regarding school facilities, academic activities, attendance, programmes and other school-related services.

Problem Statement: Develop an AI assistant that provides verified school-related information through a simple conversational interface while ensuring that sensitive student information is appropriately protected.

ED-03 — AI-Based School Performance & Learning Gap Analytics

Government-side problem: Education officials need to analyse data from many schools to identify learning gaps and schools requiring additional academic support.

Problem Statement: Develop an AI analytics system that analyses anonymised/synthetic assessment data to identify subject-wise and school-wise learning patterns, gaps and areas requiring intervention.

ED-04 — AI-Based School Resource Planning System

Government-side problem: Education authorities need to plan teachers, classrooms, laboratories, computers and other resources across schools with different requirements.

Problem Statement: Develop an AI-based decision-support system that analyses school-level data and identifies resource gaps and priority areas to support evidence-based planning.

6. YOUTH AFFAIRS & SPORTS DEPARTMENT

YAS-01 — AI-Based Sports Talent Identification

Citizen/Athlete-side problem: Young athletes with potential may not always get opportunities to be identified through conventional selection processes.

Problem Statement: Develop an AI-based system that analyses fitness measurements, performance records and sport-specific parameters to identify athletes who may merit further assessment by qualified coaches.

YAS-02 — AI-Based Athlete Performance & Technique Analysis

Citizen/Athlete-side problem: Athletes may have difficulty objectively analysing their technique and performance without continuous access to specialised coaching.

Problem Statement: Develop a computer-vision system that analyses athlete videos to identify movement patterns, posture, repetitions, speed or other relevant performance indicators and provides useful feedback for coaches and athletes.

YAS-03 — AI-Based Sports Facility Utilisation & Planning

Government-side problem: Sports authorities may not have a consolidated view of how frequently facilities are used, when demand is highest and which facilities are underutilised.

Problem Statement: Develop an AI-based system that analyses facility usage, location, demand and availability to predict utilisation patterns and support better scheduling and infrastructure planning.

YAS-04 — AI-Based Sports Event Scheduling & Management

Government-side problem: Organising sporting events involves managing athletes, teams, venues, matches and schedules while avoiding multiple conflicts.

Problem Statement: Develop an AI-assisted system that manages registrations, generates schedules, detects venue/team conflicts and provides event and performance reports.
